PSEE15207	Structures in Disaster Prone Areas	3	0	0	3

SEMESTER III

PSE15104 ADVANCED REINFORCED CONCRETE DESIGN 3 2 0 4

COURSE OBJECTIVES

- To simplify a standard reinforced concrete building into a number of manageable idealized substructures, structural elements and to construct their load paths.
- To interpret ultimate and serviceability limit state approaches in current structural design philosophy.
- To estimate primary design loads on structural elements such as beams and columns consulting appropriate standards and handbooks.
- To combine primary design load cases as per design standards to find critical load combination that governs design.
- To model building structure and analyze structural elements for design actions such as design bending moment, design shear force and deflections.

UNIT I DESIGN REGULATIONS 15

Review of limit state design of beams, slabs and columns according to IS code - Serviceability limit states - Deflection and cracking - Calculation of deflection and crack width according to IS Code.

UNIT II DESIGN OF SPECIAL RC ELEMENTS 15

Design of slender columns - Design of RC walls - Strut and tie method of analysis for corbels and deep beams - Design of corbels, deep-beams and grid floors.

UNIT III FLAT SLABS AND YIELD LINE THEORY 15

Design of Column-Supported Slabs (with/without Beams) under Gravity Loads - Direct design method - Equivalent frame method - Shear in Column - Supported two-way slabs - Design of spandrel beams - Yield line theory and Hillerborg's strip method of design of slabs.

UNIT IV PLASTIC DESIGN 15

Limit analysis - Moment redistribution - Codal recommendations for Moment redistribution - Baker's method of plastic design - Design of cast-in-situ joints in frames.

UNIT V DETAILING AND FIELD PRACTICE 15

Detailing for ductility - Measures of ductility - Flexural yielding in frames and walls - Flexural members in ductile frames - Columns and frame members subject to bending and axial load - Joints in ductile frames - shear walls - Fire resistance of structural members - Code requirements - Quality control of concrete.

TOTAL : 75 PERIODS

COURSE OUTCOMES

At the end of this course, the students will be able to

- understand and analyze the behaviour of reinforced concrete subjected to flexure, shear and axial loading.
- identify underlying plastic concepts in modern concrete design methods
- design reinforced concrete beams, slabs and columns in accordance to IS code.
- enumerate the concept of reinforced concrete, using moment redistribution and Baker's method.
- produce design calculations and drawings in appropriate professional formats.

IV SEMESTER

PSE15202 ASEISMIC ANALYSIS AND DESIGN OF STRUCTURE 3 2 0 4

COURSE OBJECTIVES

- To understand the concepts of Engineering seismology
- To analyse building for earthquake forces and introduce design concepts
- To explain the design guidelines for earthquake resistant masonry and earthen buildings
- To analyse rigid frames and shear wall for earthquake loading
- To gain knowledge in vibration control techniques

UNIT I EARTHQUAKE GROUND MOTION 15

Engineering Seismology - elastic rebound theory - plate tectonic theory - Seismic waves - earthquake size - measurement of earthquakes - strong ground motions - Tsunami - Seismic zoning map of India Information on some disastrous earthquakes.

UNIT II EARTHQUAKE ANALYSIS AND DESIGN CONCEPTS 15

Response spectra - introduction to methods of seismic analysis - Equivalent static analysis IS 1893 provisions - Response spectrum method - Time history method - Push over analysis - Mathematical modeling of multi-storey RC Building - Design methodology - Architectural consideration - geotechnical consideration - structural design consideration - Capacity design - Techniques of aseismic design.

UNIT III EARTHQUAKE DESIGN OF MASONRY BUILDINGS 15

Guidelines for earthquake resistant earthen buildings and masonry buildings - Design considerations.

UNIT IV EARTHQUAKE DESIGN OF RC STRUCTURES 15

Earthquake resistant design of RCC. Buildings - Material properties - Lateral load analysis - Design and detailing - Rigid frames - Shear wall - Coupled shear wall.

UNIT V SPECIAL TOPICS 15

Liquefaction, vibration control - Tuned mass dampers - Principles and application, Basic concept of seismic base Isolation - Various systems- Case studies

TOTAL : 75 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- describe ground motion and its relationship to seismic design of structures.
- calculate earthquake induced lateral force on the structure.
- include earthquake resistant features in masonry buildings.

- apply the basic principles of conceptual design for earthquake resistant RC buildings and carry out the detailed design of earthquake resistant RC buildings.
- adopt vibration control methods for buildings located in earthquake zone.

PSE15205 ADVANCED STRUCTURAL ENGINEERING LABORATORY 0 0 4 2

COURSE OBJECTIVES

- To design concrete mixes,
- To perform advanced laboratory experiments that emphasize the structure-property relationship, statistical analysis,technical manuscript preparation,
- To gain practical knowledge about the non destructive tests, measuring devices and their field applications.

LIST OF EXPERIMENTS

1. Concrete mix design and study of mechanical properties of concrete
2. Fresh properties of Self Compacting Concrete using slump flow, L Box and V Funnel Tests
3. Fabrication, casting and testing of simply supported reinforced concrete beam for strength and deflection behaviour.
4. Testing of simply supported steel beam for strength and deflection behaviour.
5. Fabrication, casting and testing of reinforced concrete column subjected to concentric and eccentric loading.
6. Dynamic testing of cantilever steel beam
    a. To determine the damping coefficients from free vibrations.
    b. To evaluate the mode shapes.
7. Static cyclic testing of single bay two storied steel frames and evaluate
    a. Drift of the frame.
    b. Stiffness of the frame.
    c. Energy dissipation capacity of the frame.
8. Determination of in-situ strength and quality of concrete using
    a. Rebound hammer.
    b. Ultrasonic Pulse Velocity Tester.
9. Study of Measuring devices such as
    a. BeggsDeformeter
    b. Mechanical Strain Gauge
    c. Optical strain gauge
    d. Electrical Strain Gauges

TOTAL :60 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- describe the behaviour of reinforced concrete and steel beam for strength and deflection

- analyse dynamic behaviour of cantilever steel beam
- understand the strength and quality of concrete

REFERENCES

III SEMESTER

LIST OF ELECTIVES

PSEE15101 MATRIX METHODS OF STRUCTURAL ANALYSIS 3 0 0 3

COURSE OBJECTIVES

- To develop flexibility and stiffness matrices for the single and two coordinate system.
- To transform stiffness and flexibility matrices from system coordinate to element coordinate
- To expose flexibility method and its application to pin jointed plane truss, continuous beams, frames and grids.
- To develop stiffness matrix and their application to two and three dimensional pin- jointed trusses.
- To analyse substructures by iteration methods.

UNIT I FUNDAMENTAL CONCEPTS- STIFFNESS AND FLEXIBILITY 9

Introduction-Force and displacement measurement - Generalized or Independent measurement - Constrained or Dependent measurements- Behaviour of structures - Principle of superposition - Methods of Structural analysis - Introduction structure with single coordinate - Two coordinates - Flexibility and stiffness matrices in N coordinates- Examples, symmetric nature of matrices - Stiffness and flexibility matrices in constrained measurements - Stiffness and flexibility of systems and elements - Computing displacements and forces from virtual work- Computing stiffness and flexibility coefficients.

UNIT II ENERGY CONCEPTS & TRANSFORMATION IN STRUCTURES 9

Strain energy in terms of stiffness & flexibility matrices - Properties of stiffness and flexibility matrices - Interpretation of coefficients - Betti's law (forces not at the coordinates) - Other energy theorems - Using matrix notations - Determinate, indeterminate structures - Transformation of system forces to element forces - Element flexibility to system flexibility -System displacement to element displacement - Element stiffness to system stiffness - Transformation of forces and displacements in general - Stiffness and flexibility in general - Normal coordinates and orthogonal transformation - Principle of contragradience.

UNIT III FLEXIBILITY METHOD 9

Statically determinate structures - Indeterminate structures - Choice of redundant leading to ill and well-conditioned matrices - Automatic choice of redundant- Rank technique - Transformation to one set of redundant to another - Internal forces due to thermal expansion and lack of fit - Reducing the size of flexibility matrix - Application to pin jointed plane truss - continuous beams - Frames -Grids.

UNIT IV STIFFNESS METHOD 9

Introduction - Development of the stiffness method - Stiffness matrix for structures with zero force at some coordinates- Analogy between flexibility and stiffness - lack of fit - Stiffness matrix with rigid motions - Application of stiffness approach to pin jointed plane & space trusses - Continuous beams - Frames - Grids -

Space frames introduction only - Static condensation technique- Choice of method - Stiffness or flexibility - Direct stiffness approach - Application to two & three dimensional pin- Jointed trusses.

UNIT V ANALYSIS BY SUBSTRUCTURES &ITERATION 9

Analysis by substructures using the stiffness & the flexibility method with tridiagonalisation - Iteration method for frames with non-prismatic members - Iteration method applied to rigidly connected members - Computer program for the analysis of rigidly connected beams - Efficiency of the iteration method.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- understand the basic concept of flexibility and stiffness, principle of superposition and methods of structural analysis.
- transform the flexibility and stiffness matrices from system coordinates to element coordinates.
- identify the degree of freedom and ability to formulate flexibility matrix of components of structure.
- formulate the stiffness matrix and apply to 2D and 3D structure.
- analyse the frame through the iteration methods.

PSEE15102 ADVANCED CONCRETE TECHNOLOGY 3 0 0 3

COURSE OBJECTIVES

- To summarize the properties of concrete making materials such as cement, aggregates and admixtures.
- To categorize the properties and tests on fresh and hardened concrete.
- To acquire the practical knowledge on mix design principles, concepts and methods.
- To acquire knowledge in the special concretes and their applications in the diverse construction field.
- To study the concrete manufacturing processes, concreting methods and different special formworks.

UNIT I MATERIALS FOR CONCRETE 9

Cement - Manufacturing - Types and grades of cement - Chemical composition - Hydration of cement - micro structure of hydrated cement - Testing of cement - Special cements - Aggregates - classifications - IS specifications - Properties - Grading and specified grading - Methods of combining aggregates - Testing of aggregates - Water - Physical and chemical properties - Admixtures - chemical & mineral admixtures - Mineral additives.

UNIT II PROPERTIES OF CONCRETE 9

Properties of fresh concrete - Workability - Segregation – Bleeding - Laitance - Tests on fresh concrete - Properties & tests on hardened concrete - Structural properties - Strength, factors affecting the strength of concrete - Maturity of concrete, modulus of elasticity, creep-shrinkage, factors affecting creep and shrinkage of concrete - Microstructure of concrete - Micro cracking - Testing of existing and aged structures using NDT - Variability of strength in concrete - Durability of concrete - Chemical attack on concrete.

UNIT III CONCRETE MIX DESIGNS 9

Principles of mix design - Methods of concrete mix design - Factors influencing mix proportions - IS, ACI and British methods of mix design - Statistical quality control - Sampling and acceptance criteria.

UNIT IV SPECIAL CONCRETES 9

Light weight concrete and types - Fly ash concrete - Fibre reinforced concrete types & applications - Sulphur concrete - Sulphur impregnated concrete - Polymer concrete & its types - Super plasticized and hyper plasticized concretes - Epoxy resins and screeds, properties - Their applications in rehabilitation works - High performance concrete, high performance fibre reinforced concrete - Roller compacted concrete - Self-

compacting concrete and its applications - Bacterial concrete - Recycled aggregate concrete - Smart concrete - Ferro cement and its applications.

UNIT V CONCRETING METHODS 9

Concrete manufacturing process - Stages of manufacturing - Transportation, placing and curing methods - Extreme weather concreting - Special concreting methods - Vacuum dewatering - Underwater concreting - Special form work types.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- execute and test the concrete made with cement, aggregates and admixtures.
- describe the properties and durability of fresh and hardened concrete.
- execute mix proportioning of concrete and describe how the strength of concrete can be modified by changing the proportions.
- select suitable concrete for different structures considering the prevailing weathering conditions.
- decide the correct concreting methods in the field depending upon the requirement and site conditions

SEE15103 MAINTENANCE AND REHABILITATION OF STRUCTURES 3 0 0 3

COURSE OBJECTIVES

- To expertise the students to procure the accurate idea about the maintenance of repair strategies of building.
- To identify and apply appropriate structural and construction technologies to rectify maintenance problems.
- To formulate the students comprehend the basic concepts related to materials available for repair.
- To articulate the students to deal in practice with the recent repair and demolition.
- To create an ability to prepare repair and rehabilitation method for various deteriorated structure.

UNIT I MAINTENANCE AND REPAIR STRATEGIES 9

Maintenance - repair and rehabilitation - facets of maintenance, importance of maintenance - various aspects of inspection - assessment procedure for evaluating a damaged structure - causes of deterioration

UNIT II SERVICEABILITY AND DURABILITY OF CONCRETE 9

Quality assurance for concrete - concrete properties- strength - permeability - thermal properties and cracking - Effects due to climate - temperature - chemicals - corrosion - Design and construction errors - Effects of cover thickness and cracking

UNIT III MATERIALS FOR REPAIR 9

Special concretes and mortar - concrete chemicals - special elements for accelerated strength gain - Expansive cement - Polymer concrete - sulphur infiltrated concrete - Ferro cement - Fibre reinforced concrete.

UNIT IV TECHNIQUES FOR REPAIR AND DEMOLITION 9

Rust eliminators and polymers coating for rebars during repair - foamed concrete, mortar and dry pack - vacuum concrete - Gunite and Shotcrete - Epoxy injection - Mortar repair for cracks - shoring and underpinning. Methods of corrosion protection - corrosion inhibitors - corrosion resistant steels - coatings and cathodic protection - Engineered demolition techniques for dilapidated structures - Case studies.

UNIT V REPAIRS, REHABILITATION AND RETROFITTING OF STRUCTURES 9

Repairs to overcome low member strength - Deflection, cracking, chemical disruption - weathering corrosion, wear, fire, leakage and marine exposure.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- execute and test the concrete made with cement, aggregates and admixtures.

- describe the properties and durability of fresh and hardened concrete.
- execute mix proportioning of concrete and describe how the strength of concrete can be modified by changing the proportions.
- select suitable concrete for different structures considering the prevailing weathering conditions.
- decide the correct concreting methods in the field depending upon the requirement and site conditions

PSEE15104 STRUCTURAL OPTIMIZATION 3 0 0 3

COURSE OBJECTIVES

- To describe the fundamentals of optimization concepts and their applications in the structural engineering field.
- To categorize the linear programming methods of the optimization.
- To discriminate the constrained and unconstrained variables of the various structural engineering problems.
- To prepare the various methods of optimality involving geometric and dynamic programming.
- To summarize on the various advanced techniques in the structural optimization.

UNIT I OPTIMIZATION FUNDAMENTALS 9

Optimization methods - Introduction, Problem formulation, Introduction to mathematical principles in optimization -Mathematical models - Activity - Design methodology- Civil engineering case study- Unconstrained functions - single variable- several variable- equality constraints - inequality constraints- optimization- design space- Feasible and Infeasible- Convex and concave - Active constraints- Local and Global optima - differential Calculus- Optimality criteria- Lagrange multiplier method- Kuhn- tucker Criteria.

UNIT II LINEAR PROGRAMMING 9

Formulation of problems - Graphical solution -Analytical methods - Standard form - Slack, surplus and artificial variables -Canonical form - Basic feasible solution - Simplex method - Two phase method -Penalty method - Duality theory - Primal - Dual algorithm.

UNIT III NON-LINEAR PROGRAMMING 9

Introduction to non-linear problems - One dimensional minimization methods - unimodal function - Exhaustive and unrestricted search - Dichotomous search - Fibonacci method- Golden section method - Interpolation methods. Unconstrained multivariable function - Univariate method- Cauchy's steepest descent method- conjugate gradient method (Fletcher Reeves) - Variable metric methods (Davison-Fletcher-Powell) - Direct and indirect methods - Interior Penality function - External Penalty function method.

UNIT IV GEOMETRIC PROGRAMMING AND DYNAMIC PROGRAMMING 9

Geometric Programming- Polynomial - Degree of difficulty- Reducing G.P.P. to a set of simultaneous equations - Concepts of solving problems with zero difficulty and one degree of difficulty - Dynamic Programming - Bellman's principle of optimality -Representation of a multi stage decision problem - Concept of sub -optimisation problems - Truss optimization.

UNIT V NON-TRADITIONAL METHODS 9

Genetic Algorithm - Terminology - Natural Law of Evolutions - Genetic operators - steps for solution of problems - Simulated Annealing - Algorithm - Boltzman's equation - ANT Colony optimization – Algorithm Pheromone trail - Travelling salesman problem- Introduction to TABU search - sample problem- Artificial Neural Network - Application characteristics. **TOTAL :45 PERIODS**

COURSE OUTCOMES

At the end of the course, the students will be able to

- apply the basic ideas in optimization to make the structures as lightly as possible.
- classifythe linear programming techniques in engineering optimization.
- formulate the unconstrained and constrained optimization problems in structural design.
- identify the methods in solving the problems related to geometric and dynamic Programming.
- standardize in advanced techniques of optimization such as genetic algorithm and Artificial Neural Networks.

PSEE15105 DESIGN OF TALL BUILDINGS 3 0 0 3

COURSE OBJECTIVES

- To paraphrase various aspects of planning of tall buildings and know about different types of loads
- To establish various structural systems for high rise buildings with their behaviour and analysis.
- To illustrate knowledge about analysis involved in tall structures.
- To formulate about sectional shapes and design for differential movement, creep and shrinkage effects.
- To impart knowledge about stability analysis of various systems and to know about advanced topics.

UNIT I DESIGN PRINCIPLES AND LOADING 9

General - Factors affecting growth, height and structural form - Design philosophy - Loading - Gravity loading - Wind loading - Earthquake loading - Combinations of loading - Strength and Stability - Stiffness and drift limitations - Human comfort criteria- Creep effects - Shrinkage effects - Temperature effects - Fire - Foundation settlement - Soil- structure interaction, Material.

UNIT II BEHAVIOUR OF VARIOUS STRUCTURAL SYSTEMS 9

High rise behaviour - Rigid frames, braced frames, Infilled frames, shear walls, coupled shear walls, wall-frames, tubulars, cores, futrigger - braced and hybrid mega systems.

UNIT III ANALYSIS OF TALL BUILDINGS 9

Modeling for analysis - Assumptions - Modeling for approximate analyses - Modeling for accurate analysis - Reduction techniques - Dynamic analysis - Response to wind loading - Along-wind response - Across-wind response - Estimation of natural frequencies & damping - Types of excitation - Design to minimise dynamic response - Response to earthquake motions - Response to ground accelerations - Response spectrum analysis - Estimation of natural frequencies and damping - Human response to building motions.

UNIT IV STRUCTURAL ELEMENTS 9

Sectional shapes, properties and resisting capacity, design, deflection, cracking, prestressing, shear flow - Design for differential movement - creep and shrinkage effects - temperature effects and fire resistance.

UNIT V STABILITY 9

Overall buckling analysis of frames - wall-frames - Approximate methods second order effects of gravity of loading - P-Delta analysis - simultaneous first-order and P Delta analysis - Translational - Torsional instability - out of plumb effects - stiffness of member in stability - effect of foundation rotation.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of this course the student will be able to

- know design principles and different types of loading

- describe the various structural systems used in the construction of tall structures.
- analyse the tall structures
- design of structural elements for secondary effects
- execute stability analysis, overall buckling analysis of frames, analysis for various secondary effects such as creep, shrinkage and temperature.

PSEE15106 NON - LINEAR ANALYSIS OF STRUCTURES 3 0 0 3

COURSE OBJECTIVES

- To read the concept of nonlinear behaviour of beams and vibrations of beams.
- To distinguish the elastic analysis of statically determinate and indeterminate flexural members.
- To differentiate the inelastic analysis of statically determinate and indeterminate flexural members.
- To evaluate the nonlinear analysis of plates and its governing equation.
- To discuss the governing equation of circular and non-circular shells.

UNIT I NONLINEAR BENDING AND VIBRATION OF BEAMS 9

Introduction - Types of nonlinearities - Nonlinear governing equation for beams - Geometrically nonlinear beam problems - Vibrations of beams with various boundary conditions - Forced vibration of beams - Post buckling-cantilever column - Behaviour of beams with material nonlinearity - Nonlinear vibration and instabilities of elastically supported beams.

UNIT 2 ELASTIC ANALYSIS OF FLEXURAL MEMBERS 9

Flexural behaviour - Statically determinate and statically - Indeterminate bars - Uniform and varying thickness.

UNIT 3INELASTIC ANALYSIS OF FLEXURAL MEMBERS 9

Inelastic analysis of uniform and variable thickness members subjected to small deformations - Inelastic analysis of flexible bars of uniform and variable stiffness - Members with and without axial restraints.

UNIT 4NONLINEAR STATIC AND DYNAMIC ANALYSIS OF PLATES 9

Introduction - Governing nonlinear equations for plates - Boundary conditions and methods of solutions - Large deflection analysis of rectangular and non-rectangular plates - Free and forced vibrations of rectangular and non-rectangular plates - Post buckling behaviour of plates - Effects of transverse shear deformations and material nonlinearity.Introduction - Derivations of governing equations - Circular and noncircular cylindrical shells - Shallow cylindrical shells - Forced nonlinear vibration of shells - Post buckling of shells.

UNIT 5 NONLINEAR ANALYSIS OF SHELLS 9

Introduction – Derivations of governing equations – Circular and noncircular cylindrical shells – Shallow cylindrical shells – Forced nonlinear vibration of shells – Post buckling of shells.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will able to

- describe the basic concepts of nonlinearity and its governing equation for various boundary conditions.

- categorize the elastic analysis with various boundary conditionsof thin walled structural members
- compare the inelastic analysis with various boundary conditions of thin walled structural members
- justify static and dynamic analysis of plates.
- express nonlinear analysis of shells.

PSEE15107 SMART STRUCTURES 3 0 0 3

COURSE OBJECTIVES

- To describe the basic principles and mechanisms of smart materials and devices.
- To demonstrate knowledge and understanding of the physicalprinciples underlying the behavior of smart materials.
- To outline the basic principles and mechanisms of measuring techniques.
- To practice knowledge and understanding of the engineering principles in smart sensors, actuators and transducer technology.
- To propose improvement on the design, analysis, manufacturing and application issues involved in integrating smart materials and devices.

UNIT I PROPERTIES OF MATERIALS AND ER AND MR FLUIDS 9

Piezoelectric Materials and properties - Actuation of structural components - Shape Memory Alloys - Constitutive modeling of the shape memory effect, vibration control - Embedded actuators - Electro rheological and magnetorheological fluids - Mechanisms and Properties - Fiber Optics - Fibre characteristics - Fiber optic strain sensors

UNIT II VIBRATION ABSORBERS 9

Parallel damped vibration absorber - Gyroscopic vibration absorber - Active vibration, absorber - Applications - Vibration Characteristics of mistuned systems - Analytical approach

UNIT III MEASURING TECHNIQUES 9

Strain measuring techniques using electrical strain gauges - Types - Resistance - Capacitance - Inductance - Wheatstone bridges - Pressure transducers - Load cells - Temperature Compensation - Strain Rosettes.

UNIT IV CONTROL OF STRUCTURES 9

Control modeling of structures - Control strategies and limitations - Classification of control systems - Classical control, Modern control, Optimal control and Digital control - Active structures in practice.

UNIT V APPLICATIONS IN CIVIL ENGINEERING 9

Application of shape memory - Alloys in bridges - Concept of smart bridges - Application of ER fluids - Application of MR dampers in different structures - Application of MR dampers in bridges and high rise structures - Structural health monitoring - Application of optical fibres - Concept of smart concrete.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- select various smart materials and devices.

- set up analytical approach on vibration absorbers.
- Propose various strain measurement using smart materials.
- manipulate control strategies of smart structures.
- apply principles of smart structures to civil engineering field.

LIST OF ELECTIVES

PSEE15201 DESIGN OF SUB STRUCTURES 3 0 0 3

COURSE OBJECTIVES

- To assess the soil condition at a given location in order to suggest suitable foundation based upon bearing capacity.
- To compose the design of different type of shallow foundations like isolated, raft and combined footing.
- To familiarise with the design of pile foundation and pile caps.
- To outline the design of well and caissons foundations.
- To categorize various types of design of tower foundations.

UNIT I SITE INVESTIGATION, SELECTION OF FOUNDATION AND BEARING CAPACITY 9

Objectives - Methods of exploration - Depth of exploration - Sample disturbance - Factors governing location and depth of foundation - In situ testing of Soils - Plate load test - Geophysical methods - Selection of foundation- Bearing capacity of shallow foundations by Terzaghi's theory, Meyerhof's theory, and codal provisions - Bearing capacity of footing subjected to inclined and eccentric loading - Problems - Types of shear failure - General principles of foundation design – Foundations on expansive soil.

UNIT II DESIGN OF SHALLOW FOUNDATIONS 9

Types of shallow foundations - General principles of design of reinforced concrete shallow foundations - Structural design of isolated and combined footing - Structural design of rafts by conventional method - Principles of design of buoyancy raft and basement (no design problems).

UNIT III PILE FOUNDATION 9

Pile foundations - Types - General principles of design - Estimation of load capacity of piles by static and dynamic formulae - Detailing of reinforcement as per IS 2911 - Design of Piles and Pile caps - Settlement analysis of pile groups - Negative skin friction - Pile load tests.

UNIT IV WELL AND CAISSON FOUNDATIONS 9

Well and caisson foundations - Structural elements of Caisson and Well foundations - Elements of well foundation - Forces acting on Caisson and well foundations - Design of individual components of Caisson and well foundation(only forces acting and design principles) - Sinking of well - Shifts and tilts in well foundations - Preventive measures.

UNIT V FOUNDATIONS OF TRANSMISSION LINE TOWERS 9

Introduction - Necessary information - Forces on tower foundations - General design criteria - Choice and type of foundation - Design procedure -Types of Foundations - Design of foundation for transmission towers.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course the students will be able to

- attain the perception of site investigation to select suitable type of foundation based on soil category.
- design concepts of shallow foundation.
- select suitable type of pile for different soil stratum and in evaluation of group capacity by formulation
- design different types of well foundation.
- design the concepts of transmission line tower foundation

PSEE15202 EXPERIMENTAL TECHNIQUES AND INSTRUMENTATION 3 0 0 3

COURSE OBJECTIVES

- To define the errors in measurement and the principles of measurement using various electronic and physical testing machines.
- To dramatize with vibrating measuring instruments and digital and electronic display using different sensors.
- To define the wind flow measurement and pressure measurement and scale different models using direct model study and indirect model study.
- To measure the distress in concrete structures using various electrical and electronic machineries.
- To test various civil engineering structures using Non Destructive Testing methodologies.

UNIT 1 FORCES AND STRAIN MEASUREMENT 9

Choice of Experimental stress analysis methods, errors in measurements - Strain gauge - principle - types, performance and uses- Hydraulic jacks and pressure gauges - Electronic load cells - Proving Rings - Calibration of Testing Machines - Long-term monitoring - Vibrating wire sensors- Fibre optic sensors.

UNIT 2 VIBRATION MEASUREMENTS 9

Characteristics of structural vibrations - Linear variable differential Transformer (LVDT) - Transducers for velocity and acceleration measurements - Vibration meter - Seismographs - Vibration Analyzer - Display and recording of signals - Cathode Ray Oscilloscope - XY Plotter - Chart Plotters - Digital data Acquisition systems.

UNIT 3 ACOUSTICS AND WIND FLOW MEASURES 9

Principles of Pressure and flow measurements - Pressure transducers - sound level meter - Venturimeter and flow meters - Wind tunnel and its use in structural analysis - structural modeling - Direct Model Study and Indirect Model study.

UNIT 4 DISTRESS MEASUREMENTS AND CONTROL 9

Diagnosis of distress in structures - Crack observation and measurements - Corrosion of reinforcement in concrete - Half cell, construction and use - Damage assessment - Controlled blasting for demolition - Techniques for residual stress measurements.

UNIT 5 NON DESTRUCTIVE TESTING METHODS 9

Load testing on structures, buildings, bridges and towers - Rebound Hammer - Acoustic emission - Ultrasonic testing principles and application - Holography - Use of laser for structural testing - Brittle coating, Advanced NDT methods - Ultrasonic pulse echo, Impact echo, impulse radar techniques, GECOR - Ground penetrating radar (GPR).

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- choose the methodology of measuring errors and strains and calibrate the machineries and equipment used in the laboratory.
- Operate various vibration measuring instruments and analyse the structures using digital display unit.
- indicate the model using direct and indirect model analysis (Using Buckingham PI Theorem).
- measure distress in the structures using various electronic equipment.
- employ advanced NDT methods in accessing the load testing of structures.

PSEE15203 COMPUTER AIDED ANALYSIS AND DESIGN OF STRUCTURES 3 0 0 3

COURSE OBJECTIVES

- To familiarise with graphic primitives, transformations and 2-D drafting of computer graphics.
- To get practiced with computer methods of structural analysis.
- To understand the structural design concepts.
- To familiar with linear programming and CPM and PERT.
- To inculcate the students with Artificial Intelligence.

UNIT I COMPUTER GRAPHICS 9

Graphic primitives - Transformations - Basics of 2-D drafting - Modeling of curves and surfaces – Wire frame modeling - Solid modeling - Graphic standards - Drafting software packages and usage

UNIT II STRUCTURAL ANALYSIS 9

Computer aided analysis of steel and RC Structural elements – Application of software.

UNIT III STRUCTURAL DESIGN 9

Computer aided design of steel and RC Structural elements - Detailed drawing – Bill of materials

UNIT IV OPTIMIZATION 9

Application of linear programming - Simplex algorithm - Post-optimality analysis - Project scheduling - CPM and PERT applications

UNIT V ARTIFICIAL INTELLIGENCE 9

Introduction - Heuristic search - knowledge based expert systems – Rules and decision tables – Inference mechanisms- Simple applications - Genetic algorithm and applications - Principles of Neural network - Architecture and applications of KBES - Expert system shells.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- familiar with 2 D drafting and can use drafting software.
- perform structural analysis using analysis package
- design the structures with computer methodologies.
- optimize the structural design with various computer packages and graphics.
- apply artificial intelligence to real life applications.

PSEE15204 DESIGN OF BRIDGES 3 0 0 3

COURSE OBJECTIVES

- To study the various bridge forms and typical loadings on the bridges.
- To get familiarized with the design of short span bridges.
- To possess knowledge on the design concepts of long span bridges.
- To design the prestressed concrete bridges.
- To understand the concept of designing the substructure for bridges, plate girder to IRC loadings, foundation for bridges and bearings

UNIT I DESIGN PRINCIPLES 9

General basic bridge forms - Beam, arch, suspension, various types of bridges, selection of type of bridge and economic span length, drainage, road, kerb, classification, investigation and planning. design loads for bridges - Dead load, live load, IRC loading, IRS loading, Aashto loading, wind load, longitudinal forces, centrifugal forces, buoyancy, water current forces, thermal forces deformation and horizontal forces

UNIT II SHORT SPAN BRIDGES 9

Design of culvert, Deck slab bridge - T - Beam girder bridge - Pigeaud's Theory - Courbon's Method

UNIT III LONG SPAN BRIDGES 9

Design principles of continuous bridges - box girder bridges and balanced cantilever bridges.

UNITIV DESIGN OF PRESTRESSED CONCRETE BRIDGES 9

Flexural and Torsional parameters - Courbon's Theory - Distribution Coefficient by exact analysis - Design of girder section - maximum and minimum prestressing forces - Eccentricity - Live load and dead load shear forces - Cable Zone in Girder - Check for stresses at various sections - Check for diagonal tension - Diaphragms - End Block - Short term deflections.

UNIT V DESIGN OF PLATE GIRDER BRIDGES , BEARINGS AND SUBSTRUCTURES 9

Design of riveted and welded plate girder bridges - Wind effects - Main section, splicing, curtailment, stiffeners - Different types of bearings - design of bearings - Design of masonry and concrete piers and abutments - Types of bridge foundations - Design of foundations - Footings - Pile foundations.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- understand the design theories for super structure and sub structure of bridges
- design short span bridges.
- Understand the behaviour of continuous bridges, box girder bridges.
- Design prestressed concrete bridges.

- design railway bridges, plate girder bridges, different types of bearings , abutments, piers and various types of foundations for Bridges

PSEE15205 MECHANICS OF COMPOSITE MATERIALS 3 0 0 3

COURSE OBJECTIVES

- To describe the composite materials and properties of composite fiber and matrix constituents.
- To state stress strain relation of orthotropic and anisotropic materials
- To recall the static, dynamic and stability analysis for simpler cases of composite plates.
- To elucidate the failure criterion and fracture mechanism of composites.
- To identify the metal and ceramic composite & design with composites

UNIT I INTRODUCTION 9

Introduction to composits – Classification composits materials and their properties – Commonly used fyber and matrix constituents – composit construction – Properties of Unidirectional Long Fiber Composits – Shorts Fiber Composits.

UNIT II STREES STRAIN RELATION 9

Concepts in solid mechanics – Hooke's Law orthotropic and anisotropic materials – Linear Elasticity for Anisotropic materials – rotation of streeses,strain,residual,streeses.

UNIT III ANALYSIS OF LAMINATED COMPOSITS 9

Governing equation for anisotropic and orthopic plaste – Angle ply and cross ply laminates. Static. Dynamic and stability analysis for simpler cases of composits plates. Inter Laminar streeses.

UNIT IV FAILURE AND FRACTURE OF COMPOSITS 9

Nettinganalysis – Failure criterion – maximum stress – maximum strain , fracture machines of composits - Sandwich construction.

UNIT V APPLICATION AND DESIGN 9

Metal and ceramic matrix composites - Applications of composites, composite joints - Design with composites- Review, Environmental issues

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- categorize the fibre types and classify the composite material.
- understand the stress –strain properties, longitudinal and transverseproperties of composites lamina.
- analyse the laminated composites and compute the lamina strength.
- locate the failure criterion and fracture mechanics of composites.
- relate the load deformation relation, residual stresses for the design of composites.

PSEE15206 ENERGY EFFICIENT STRUCTURES 3 0 0 3

COURSE OBJECTIVES

- To elucidate the energy audit systems in buildings.
- To create awareness of the necessity of energy needed for structures.
- To study the different climate types and their influence in building design.
- To focus on the thermal environment of structures
- To equip the knowledge of appliances and their utilisation in buildings.

UNIT I ENERGY EFFICIENT CONCEPTS 9

Need of energy in buildings - assessment - Energy consumption pattern of various types of buildings - Factors influencing the energy use in building - Concepts of energy efficient building.

UNIT II CLIMATE 9

Study of Climate types - their influence in building design - Environmental factors affecting building design - Analysis of thermal and visual environment.

UNIT III HEAT AND LIGHT 9

Heat gain and loss phenomenon in buildings - Thermal performance parameters - Role of building enclosures, openings and materials in thermal environment - Basic principles of light and daylight - Energy efficient light design of buildings - Daylight design of buildings.

UNIT IV APPLIANCES IN BUILDINGS 9

Major appliances in building and their energy consumptions - Principles of solar heating, cooling and power (PV) systems - Integration of energy efficient appliances with the buildings.

UNIT V ENERGY AUDIT 9

Energy survey and energy audit of buildings - Calculation of energy inputs and utilization in buildings - Energy audit reports of buildings - Concepts of Green Buildings - energy rating of buildings.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the student will be able to

- introduce various energy consumptions
- understand the climate and environmental factors affecting building design.
- gain knowledge in design of buildings according to thermal environment.
- acquire the skills in utilisation of appliances and the principles behind them.
- obtain the knowledge in energy audit in buildings

PSEE15207 STRUCTURES IN DISASTER PRONE AREAS 3 0 0 3

COURSE OBJECTIVES

- To know the various types of disaster caused by the nature and disaster prone areas in India.
- To gain knowledge in the response of the structure for various disaster.
- To obtain a brief knowledge about the planning and preparedness for a disaster.
- To know about the various modern materials and tools used in disaster reduction.
- To gain knowledge about the various organisations involved in disaster management.

UNIT I DISASTER 9

Introduction - Types of disasters - Disaster mitigating agencies and their organization structure at different levels - Overview of disaster situations in India - Vulnerability profile of India and vulnerability mapping including disaster prone areas, communities and places.

UNIT II RESPONSE OF THE STRUCTURE 9

Philosophy for design to resist Earthquake, Cyclone and flood -By-laws of urban and Semi-Urban areas- Traditional and modern structures. Response of dams, bridges, buildings - Testing and evaluation - Classification of structures from safety point of view - Methods of strengthening for different disasters - Qualification test.

UNIT III SEISMIC VULNERABILITY OF URBAN AREAS 9

Seismic response of R.C frames buildings with soft first storey - Preparedness and planning for an urban earthquake disaster - Tsunami and its impact - Urban settlements.

UNIT IV MODERN MATERIALS AND TECHNIQUES 9

Use of modern materials their impact on disaster reduction - Use of modern analysis, design and construction techniques - Optimization for performance - Damage surveys - Maintenance and modifications to improve hazard resistance - Different types of foundation and its impact on safety.

UNIT V DISASTER MANAGEMENT 9

Landslide hazards zonation mapping - Geo-environmental problems associates with the occurrence of landslides - Role of remote sensing, science and technology - Rehabilitation programmes - Management of Relief Camp - information systems and decision making tools, voluntary agencies and community participation - various stages of disaster Management.

TOTAL :45 PERIODS

COURSE OUTCOMES

At the end of the course, the students will be able to

- know the various disasters, their characteristics, causes and impacts.
- Acquire knowledge in strengthening of structures by various methods which was affected by the

disaster.

- understand the response of building with soft first storey.
- use of various modern methodology and tools to reduce destructions.
- gain knowledge in disaster mitigating agencies.
